

[What is claimed is:]

1. A cooling device in a construction machine in which a plurality of cooling devices including an air conditioner capacitor are arranged to be superposed back and forth against the flow of the cooling air, wherein the air conditioner capacitor is structured to change the postures between a cooling posture in which the air conditioner capacitor is arranged in parallel with another cooling device and an open posture in which the front side or the rear side of the cooling device is exposed.
2. The cooling device in a construction machine according to Claim 1, in which the air conditioner capacitor and a turbocharger cooler are arranged at the front or rear sides of an oil cooler and/or a radiator against the flow of the cooling air, wherein the air conditioner capacitor and the turbocharger cooler are structured to change the postures between the cooling posture in which the air conditioner capacitor and the turbocharger cooler are provided in parallel with the oil cooler and/or the radiator, and an open posture in which the front side or the rear side of the oil cooler and/or the radiator is exposed.
3. The cooling device in a construction machine according to Claim 1, in which the air conditioner capacitor and a turbocharger cooler are arranged at the front and rear sides of an oil cooler and/or a radiator against the flow of the cooling air, wherein the air conditioner capacitor is structured to change the postures between the cooling posture in which the air conditioner capacitor is arranged in parallel with the oil cooler and/or the radiator and an open posture in which the front side or the rear side of the

oil cooler and/or the radiator is exposed.

4. The cooling device in a construction machine according to Claim 2 or 3, wherein the oil cooler and the radiator are arranged adjacent to each other from side to side against the flow of the cooling air.

5. The cooling device in a construction machine according to Claim 2 or 3, wherein the oil cooler and the radiator are arranged to be superposed back and forth against the flow of the cooling air.

6. The cooling device in a construction machine according to Claim 5, wherein the oil cooler is structured to change the postures between the cooling posture in which the oil cooler is arranged in parallel with the radiator and an open posture in which the oil cooler is arranged such that the front side or the rear side of the radiator is exposed.

7. The cooling device in a construction machine according to Claim 1, 2, 3, 4, 5, or 6, wherein the air conditioner capacitor and/or the turbocharger cooler is/are supported by the upper part of the radiator and/or the oil cooler so as to swing up and down.

8. The cooling device in a construction machine according to Claim 1, 2, 3, 4, 5, or 6, wherein the air conditioner capacitor and/or the turbocharger cooler is/are supported by the left and right sides of the radiator or the oil cooler so as to swing back and forth.

9. The cooling device in a construction machine according to Claim 1, 2, 3, 4, 5, 6, 7 or 8, wherein a pipe connected to the air conditioner capacitor and/or the turbocharger cooler can be deformed in accordance with the posture changes of the air conditioner capacitor and/or the turbocharger cooler.
